How do DNOs cope with dispersed
generation, storage > demand, EVs ?
WeChat: cstutorcs

Ofgem encouraged DNOs to innovate by investing in trials; costs are recovered via network price controls.

程序代写代做 CS 编程辅导

Electricity Network Innovation in UK

- UK electricity networks (DNO's) are facing challenges of decarbonisation
 - concern is speed of change
- Expect to deliver energy security and resilience in a low carbon economy
 - concern, kWh carbon intensity in 2030 or 2040?
 - Government states this needs to be 70gCO₂/kWh but Committee for Climate Change wants 50gCO₂/kWh
 - What will the UK achieve?
- Since DNO's and the TSO are natural monopolies, Government and Ofgem's framework for regulating the DNO's is critical in ensuring Net-Zero is achieved
 - concern, will Government and Ofgem stick to its timetable for Net-Zero.

Smart Grids & Sustainable Energy Systems

Page – 16 of 42

程序代写代做 CS 编程辅导

Ofgem LCNF Tier-1 smart-grid projects (operated 2010 – 2015)

Tier-1 projects allowed DNOs a proportion of expenditure incurred on small projects.

Tier-1 projects had to trial a:

- specific piece of new (unproven) equipment with direct impact on Distribution System
- novel application of existing Distribution System equipment
- new operational practice for Distribution System
- novel commercial arrangement with a Distribution System User

WeChat: cstutorcs

Tier-1 projects had to demonstrate they:

- accelerate development of low-carbon energy sector and provide net financial benefit to customers
- have direct impact on DNO's Distribution System
- generate new knowledge that can be shared amongst all DNOs
- focus on network methods that are at the trial stage
- do not lead to unnecessary duplication with other projects

QQ: 749389476

<https://tutorcs.com>

程序代写代做 CS 编程辅导

Electricity North West Tier-1 Projects:

- **'Bidoing' Smart Fuse:**

- install “Smart Fuses” on the Low Voltage (LV) network and determine if they are able to reduce the impact of transient faults.

- **Voltage Management on LV Busbars:**

- deploy and assess range of voltage management technologies and techniques across 15 distribution substations.

- **Low Voltage Network Solutions:**

WeChat: cstutorcs

- deploy monitoring equipment to provide greater understanding of the operating characteristics and demands of LV networks.

Assignment Project Exam Help

- **Low Voltage Integrated Automation:**

- new integrated solution for voltage control of LV networks.

Email: tutorcs@163.com

- **Low Voltage Protection And Communications:**

- develop & implement advanced protection & communications to meet the requirements of future LV networks.

QQ: 749389476

- **Fault Current Active Management:**

- methods other than network reinforcement to reduce fault levels.

<https://tutorcs.com>

ENW Tier-1: Low Voltage Network Solutions:

- Project will deploy measurement and recording equipment to help ENW understand operating and demand characteristics of LV networks
- University of Manchester helped select a meaningful sample of representative LV network feeders.
- Activities:
 - measurement and data collection
 - network modelling
 - developing appropriate LV network solutions
 - validating conclusions of other UK LV trials on ENW network

ENW Capacity to Customers (C_2C)

程序代写代做 CS 编程辅导
Demo Project: 2012 - 2015

- Electricity North West (ENW) invested £10M to develop C_2C , aims to:
 - release untapped capacity by network capacity
 - customers savings by changing how electricity is used
 - prevents infrastructure improvement costs being passed to customers
- How ENW will increase capacity:
 - network operator must plan for the future and invest customers money into the region's electricity network.
 - trial smart-grid technology to reduce need for investment
 - C_2C provides more power using existing assets. It could deliver the extra capacity without expanding the network.

WeChat: cstutorcs

Assignment Project Exam Help

Main findings are:

C2C releases extra capacity and delivers economic and carbon benefits

Project demonstrated C2C can unlock real benefits for customers such as quicker new network connections at lower cost and cheaper distribution use of system costs.

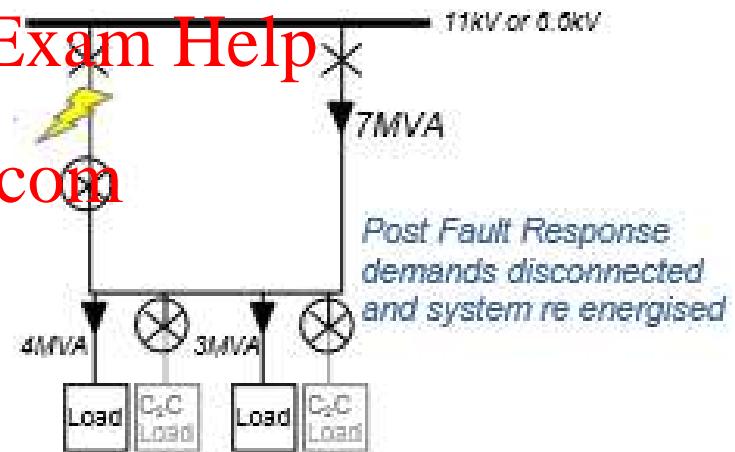

Our industrial and commercial customers are willing to sign up to C2C contracts

Customers offered a monthly payment or a reduced new connection charge in exchange for allowing us to manage their connection in the event of a fault. During the project we signed up ten existing customers and ten new connection agreements.

UK Government “smart-grid” policies

- UK Department of Business, Energy & Industrial Strategy (BEIS) is developing the strategic, regulatory and policy frameworks to ensure “UK’s electricity distribution network can efficiently deliver secure & clean energy that meets UK’s energy security and climate goals”
 - In recognition of this, Ofgem introduced a new innovation funding streams, beginning with the Low Carbon Network Fund (LCNF) for electricity distribution projects in 2010.
 - In 2015, this was replaced by Network Innovation Competition (NIC) and Network Innovation Allowances (NIA) under the RIIO-ED1 price control (Revenue = Incentives + Innovation + Outcomes) regime.

Assignment Project Exam Help

- RIIO-ED1 will end in 2023, and will be replaced with RIIO-ED2.
 - RIIO-ED2 price control sets the outputs the 14 electricity Distribution Network Operators (DNOs) need to deliver for their consumers and the revenues they are allowed to collect from 1 April 2023 to 31 March 2028.

QQ: 749389476

- Success of LCNF and RIIO-ED1 enabled DNO's to create projects, demonstrating new technologies and working practices that are now being adopted as business-as-usual by companies to deliver savings for customers. <https://tutorcs.com>

FlexDGrid: Advanced Fault Level Management

- Western Power Distribution (WPD) has received £13.5M from UK energy regulator to revolutionise the power network in Birmingham.
- WPD will use new solutions to integrate more local generation.
- connection of generation to the network increases fault level

程序代写代做 CS 编程辅导 FlexDGrid: Advanced Fault Level Management

Connection of generation directly to utility networks can increase the fault level.

FlexDGrid will investigate:

- Enhancing simulation processes to predict short-circuit currents.
- Monitoring the network in a greater detail.
- Installing new technologies that allow for early detection of short-circuit currents when faults occur in the electricity network.

Following a procurement exercise the Fault Level Measurement (FLM) device selected was built by S&C Electric. The device was based on the one installed under the WPD Tier-1 project with changes to add additional monitoring and communications.
<https://tutorcs.com>

程序代写代做 CS编程辅导

This project ended in Mar 2017 and is now closed.

FlexDGrid: Advanced Fault Management (Birmingham)

Duration	Dec 2012 - Mar 2017
Region	West Midlands.

EXPEI

£15,

FlexDGrid offered improved solution to the problem of cost-effective integration of customers' generation and demand within urban Voltage (HV) electricity networks.

Project sought to explore benefits arising from trials of complimentary Methods:

- (a) Enhanced Fault Level Assessment; (Beta) Real-time Management of Fault Level; & (Gamma) Fault Level Mitigation Technologies.

Outcomes for Method Alpha were:

- detailed 11kV network models of 15 primary substations and an automated procedure for updating or developing further network models for Fault Level assessments.
- user-friendly Excel-based tool for use in primary system design for Fault Level assessments of HV networks of primary substations where FCLs have been installed.

Outcomes for Method Beta were:

WeChat: cstutorcs Assignment Project Exam Help

- FLMs allowed Make & Break Fault Level values to be assessed, enabling networks to operate based on these values, increasing network security & facilitating new customer connections.
- Fault Level data was fed back into models allowing updates to planning Fault Levels.
- policy documents were developed to assist with connection & operation of FLMs.

Outcomes for Method Gamma :

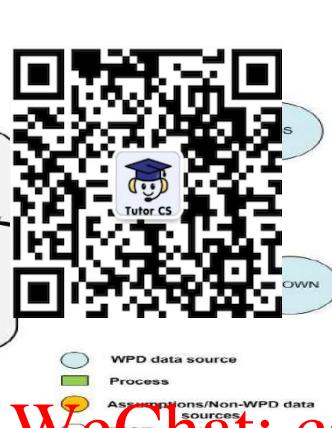

- PSCFCL (Pre-Saturated Core Fault Current Limiter) installed at Castle Bromwich 132/11kV Substation
- RSFCL (Resistive Superconducting Fault Current Limiter) installed at Chester Street 132/11kV Substation
- RSFCL at Bournville 132/11kV Primary Substation

QQ: 749389476

<https://tutorcs.com>

The FLEXGRID Solution can potentially deliver £1Bn savings across GB through the avoidance of network reinforcement and safeguarding of electricity network assets. This could facilitate 6 GW of generation connections and offset 5.05 MtCO₂ / year.

程序代写代做 CS编程辅导

WeChat: cstutorcs

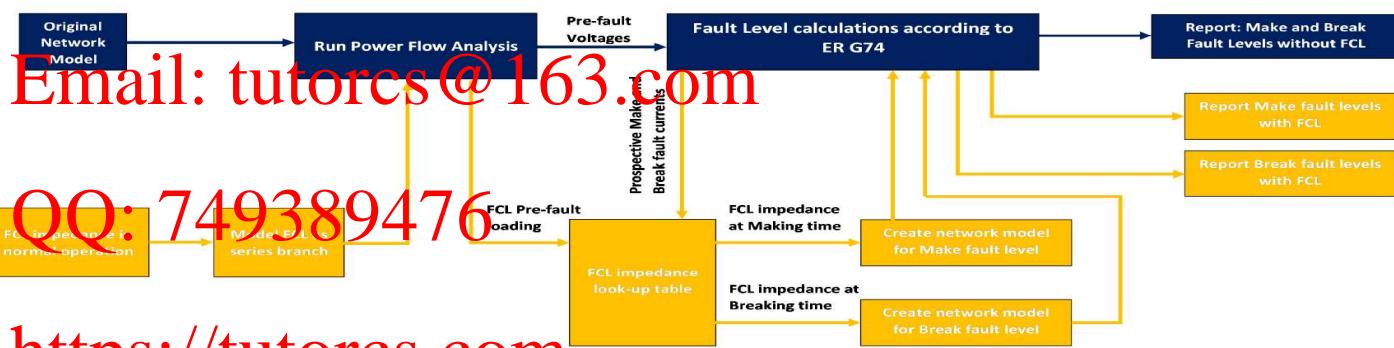

The following work was carried out:

- A sample PSS/E model of a network, representing part of Birmingham's 11kV network, was considered;
- The parameters of the sample model were varied within the range given in Table 6-3 within an assumed time to create different operation condition scenarios; and
- The corresponding Fault Levels of each scenario were calculated. The results were then compared with calculated Fault Levels from the original model to understand the impact of the each network parameter on the network Fault Level.

Parameter	Variation range
Generation power factor (PF)	Unity, 0.95 leading, 0.95 lagging, Voltage control mode ($V_{set} = 1 \text{ pu}$)
Tap position at Primary Substation	Voltage at 11 kV busbar changes between 0.95 per unit to 1.03 per unit
Demand	- 10% to + 10%
General load fault in-feed	0 to 2 MVA per MVA of load

What happens when a short-circuit fault occurs on the 11kV busbar?

Synchronous generators deliver an AC component of fault current that reduces from very-high “sub-transient” value to a high “transient” value to a lower “steady state” value, as shown:

It also delivers a DC component, which is actually an exponential defined by X/R , it can start with a magnitude equal to the peak value of the AC sub-transient current, as shown:

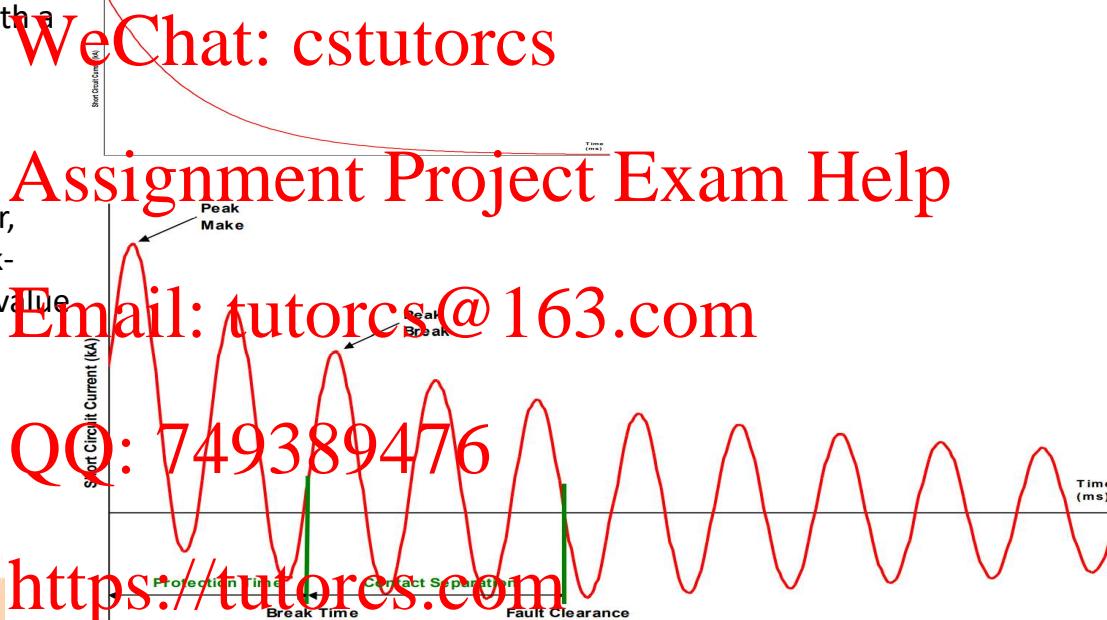

If you add the AC & DC components together, you have an offset fault current with a “peak-make” value that is 2 – 3x the “peak-break” value

Fault levels before connection

程序代写代做 CS编程辅导

Heat maps demonstrate effect of FCLs on Fault Levels at/near Castle Bromwich, Chester Street & Bournville Primary Substations

Three network arrangements
are considered:

程序代写代做 CS编程辅导

FlexDGrid: Fault Level Management using Fault Current Limiters

- Fault Current Limiters (FCL) allow the 11kV side to operate in parallel (i.e. multiple 132/11kV transformers) and distributed generators supply each 11kV busbar.
- Improves reliability & reduces customer outage times. e.g. single 132/11kV transformer can trip, without disconnecting load.
- However, Fault Current limiters are large, expensive, and simpler solutions are possible.
- Probably explains why Fault Current Limiters are “business as usual” on DNO networks.
- I believe fault current monitoring is needed at points that include synchronous Distributed Generators or where the fault level is close to the breaker “making or breaking” capacity.
- Information from fault current monitor could be used to control how a fault is cleared.
 - If the 3-phase fault current is above breaker capacity then the busbar could be split, or the DG disconnected, prior to tripping the main breaker.

<https://smarter.energynetworks.org/>

The Enhanced Power Flow Control Capability (EPFCC) project will investigate the operating performance of existing Quadrature Boosters and use the resulting knowledge to better understand if new control strategies will allow more effective power flow control and help manage future network constraints. It will also explore how innovative solutions in phase with former designs could deliver transportable modular solutions sufficiently flexible to cope with future demand and the power flow changes during the energy transition. It will also investigate how numerous suitably sized and optimally placed power flow devices can be effectively coordinated to maximise the power transfer capabilities of critical transmission boundaries, whilst minimising risk and ensuring resilience and reliability.

WeChat: cstutorcs

Assignment Project Exam Help

The project investigates solutions to enable a wider range of tap moving in post fault

action, a coordinated control of multiple QBs, and strategic sizing and location of the power flow control devices to fully utilise the capability of these QB devices and enhance power flow control capability in the network. It'll bring significant benefits on reduced

constraint management cost and increased boundary transfer capability of the transmission network, which could delay or reduce the need for new builds and bring cost savings to consumers.

Project summary

FUNDING MECHANISM:

- Network Innovation Allowance

TECHNOLOGY:

- Stakeholder Engagement

EXPENDITURE:

£160,000

This project looked to explore the public perception of consultations for large infrastructure projects and the search problem of underlying public disengagement with this process. The research carried out in this project contributes conceptually, methodologically and empirically to the field by addressing the research problem through a high voltage overhead powerline case study research design in Cumbria. The outcomes from this research are both theoretical and practical. The conceptual framework and research methods (theoretical) lead to a novel academic approach to investigating public engagement with the energy industry and the empirical output will help to inform the development of public engagement strategies in practice.

WeChat: cstutorcs

Presentations covering work carried out in the project around topics such as communities, engagement and planning were given at the following events:

1. 'Hard to Reach or Hard to Engage?' - Energy and Communities Seminar, July 2015, University of Exeter
2. *The second heard voice in public engagement with major infrastructure* - UK-Ireland Planning Research Conference 2016, Cardiff University
3. *Exploring public disengagement from proposed overhead powerline consultation processes through a Bourdieuian lens* - 4th Energy and Society Conference, 2018, University of Exeter
4. *Public disengagement from the decision-making process for Nationally Significant Infrastructure projects* - Exeter Energy 5th Making Sense of Sustainable Energy Systems Seminar, 2019, University of Exeter
5. *Exploring public disengagement from Consultation processes for major infrastructure through a Bourdieusian lens* - UK Ireland Planning Research Conference, 2019, University of Liverpool
6. *Investigating the role of symbolic violence in understanding public disengagement from planning for energy infrastructure* - Royal Geographical Society Annual International Conference, 2021.
7. *Investigating public disengagement from planning for major infrastructure projects: A high voltage powerline case study – Findings and reflections*, University of Exeter Economic & Social Research Group presentation, May 2022.
